1. mathtools command
2. Dollar text mistaken for inline math
3. Inline code containing math delimiters
4. Fenced code containing math delimiters
5. Display math inside paragraph text

markdown2pdf formula rendering repros

This file intentionally contains edge cases that are likely to render incorrectly with the current exporter.

1. mathtools command

The following requires the MathJax mathtools extension. In the current build, `\mathclap` may appear as red literal text in the PDF.

$$x + y$$

2. Dollar text mistaken for inline math

The price should remain plain text, and only `$x+1$` should be math:

Price is \$5 plus inline $x + 1$.

This escaped dollar should remain text, and only `$y$` should be math:

Escaped opener: `$x$` then real y .

3. Inline code containing math delimiters

The inline code below should stay exactly as `$x$`, not become `\(x\)`:

`$x$`

4. Fenced code containing math delimiters

The fenced code below should remain source code. It should not render math and should not leave legacy math placeholders in the PDF.

x

y

$\mathop{\mathrm{clap}}\{x+y\}$

5. Display math inside paragraph text

This line has display delimiters in the middle: $x^2 + y^2 = z^2$ text after the formula.

List item with display delimiters: $a+b$ trailing text after display math.

Before a single-dollar block without blank lines:

$$a + b$$

After the single-dollar block.
